2. Product Information

- a. **EUT Name:** Barrier (Curtain) Sensor
- b. **Model No. :** BS-800
- c. **CPU Type :** N/A
- d. **CPU Frequency :** N/A
- e. **Crystal/Oscillator(s) :** 4 MHz
- f. **Chassis Used :** ABS
- g. **Port/Connector(s) :** N/A
- h. **Power Rating :** DC 10~30V
- i. **Condition of the EUT :** Prototype Sample Engineering Sample
 Production Sample
- j. **Test Item Receipt Date :** DEC. 08, 2003

2a. Product Technical Judgement

Based on the major electrical and mechanical constrictions of the EUT, We hereby declare that the subject product does fully comply with the following EMC requirements without additional test required :

- 1) EN 61000-3-2: 2000
- 2) EN 61000-3-3: 1995+A1: 2001
- 3) EN 61000-4-6: 1996+A1: 2001
- 4) EN 61000-4-11: 1994+A1: 2001

These test standards will be applicable to both of PEP EMC verification and declaration of conformity for technical reference.

3. EUT Description and Test Conclusion

The equipment under test (EUT) is Barrier (Curtain) Sensor model BS-800, BS-600, BS-400 and BS-200. These models have identical electrical designed and construction except the followings are different:

Model No.	BS-800	BS-600	BS-400	BS-200
Beams	8 beams	6 beams	4 beams	2 beams
Height (housing)	201 cm	153 cm	105 cm	57 cm

After verifying these models, we only took the worst-case model BS-800 for test. The EUT that consists of two parts is used for the application of indoor/outdoor security system. The maximum sensing range of EUT is 8 meters outdoor. DC 10V~30V from any DC power source is required to operate EUT. For more detail specification about the EUT, please refer to the user's manual.

Test method: According to the major function designed, the EUT configuration was set up by the following steps for test.

- (A) Erect EUT and arrange its placement within sensing range.
- (B) Feed EUT DC 12V from DC power supply.

The EUT configuration was set to proceed with test. The test was carried out on EUT operational condition and the worst-case test result was recorded and provided in this report.

Conducted emission test:

N/A

Radiated emission test:

The maximum readings were found by varying the height of antenna and then rotating the turntable. Both polarization of antenna, horizontal and vertical, are measured. The effect of varying the position of the interface cables has been investigated to find the configuration that produces maximum emission.

The highest emissions were also analyzed in details by operating the spectrum analyzer in fixed tuned quasi-peak mode to determine the precise amplitude of the emissions.

In addition, the following test standards are applicable for related tests being carried out on the same EUT configuration and operational condition kept during radiated emission test :

EN 61000-4-2, EN 61000-4-3, EN 61000-4-4 and EN 61000-4-5, and Main Supply Voltage Variations.

4. Modification(s):

Power Cord : Non-Shielded, Detachable, 1m

7. EN 55022 Conducted Disturbance Test

Test Standard	Model No.	Result
EN 55022	BS-800	N/A

8. EN 55022 Radiated Disturbance Test

Test Standard	Model No.	Result
EN 55022	BS-800	Passed

8.1 Radiated Disturbance Test Description

Preliminary measurements were made indoors chamber at 3 meter using broadband antennas, broadband amplifier, and spectrum analyzer to determine the frequency producing the maximum EME. Appropriate precaution was taken to ensure that all EME from the EUT were maximized and investigated. The system configuration, clock speed, mode of operation or video resolution, turntable azimuth with respect to the antenna were noted for each frequency found. The spectrum was scanned from 30 to 1000 MHz using logbicon antenna. Above 1GHz, linearly polarized double ridge horn antenna were used.

Final measurements were made outdoors at 10-meter test range using biconical, dipole antenna or horn antenna. The test equipment was placed on a wooden bench situated on a 1.5x1 meter area adjacent to the measurement area. Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. Each frequency found during pre-scan measurements was re-examined and investigated using Quasi-Peak Adapter. The detector function was set to CISPR quasi-peak mode and the bandwidth of the receiver was set to 120kHz.

The half-wave dipole antenna was tuned to the frequency found during preliminary radiated measurements. The EUT, support equipment and interconnecting cables were re-configured to the set-up producing the maximum emission for the frequency and were placed on top of a 0.8-meter high non-metallic 1 x 1.5 meter table. The EUT, support equipment, and interconnecting cables were re-arranged and manipulated to maximize each EME emission. The turntable containing the system was rotated; the antenna height was varied 1 to 4 meters and stopped at the azimuth or height producing the maximum emission.

8.2 Radiated Disturbance Test Setup

EUT = Equipment Under Test

8.3 Radiated Disturbance Test Limits

Limits for radiated disturbance of Class A ITE at
a measuring distance of 10 m

Frequency MHz	Field Strength dB(μ V/m)
30 to 230	40
230 to 1 000	47
NOTES 1 The lower limit shall apply at the transition frequency. 2 Additional provisions may be required for cases where interference occurs.	

Limits for radiated disturbance of Class B ITE at
a measuring distance of 10 m

Frequency MHz	Field Strength dB(μ V/m)
30 to 230	30
230 to 1 000	37
NOTES 1 The lower limit shall apply at the transition frequency. 2 Additional provisions may be required for cases where interference occurs.

9. EN 61000-4-2 Electrostatic Discharge Test

Test standard	Model No.	Result
EN 61000-4-2	BS-800	Passed

Criteria for Compliance:

There shall be no damage, malfunction or change of status due to the conditioning. Flickering of an indicator during the application of the discharges is permissible, providing that there is no residual change in the EUT or any change in outputs.

9.1 Electrostatic Discharge Test Description

This standard relates to equipment, systems, sub-systems and peripherals which may be involved in static electricity discharges owing to environmental and installation conditions, such as low relative humidity, use of low-conductivity (artificial-fibre) carpets, vinyl garments, etc., which may exist in allocations classified in standards relevant to electrical and electronic equipment.

The test set-up shall consist of a wooden table, 0.8 m high standing on the ground reference plane. A horizontal coupling plane(HCP), 1.6 m x 0.8 m, shall be placed on the table. The EUT and cables shall be isolated from the coupling plane by an insulating support 0.5 mm thick .

A ground reference plane shall be provided on floor of the laboratory. It shall be metallic sheet of 0.25 mm minimum thickness. The minimum size of the reference plane is 1 m, the exact size depending on the dimensions of the EUT .

It shall project beyond the EUT or coupling plane by at least 0.5 m on all sides. and shall be connected to the protective grounding system.

In order to minimize the impact of environmental parameters on test results, the tests shall be carried out in climatic and electromagnetic reference conditions.

Climatic conditions

- ambient temperature: 15 °C to 35°C;
- relative humidity: 30 % to 60%
- atmospheric pressure: 86 KPa (860 mbar) to 106 KPa (1 060 mbar).

NOTE – Any other values are specified in the product specification.

Electromagnetic conditions

The electromagnetic environment of the laboratory shall not influence the test results.

9.2 Electrostatic Discharge Test Setup

10. EN 61000-4-3 Radio-Frequency Electromagnetic Field Test

Test standard	Model No.	Result
EN 61000-4-3	BS-800	Passed

Field Strength : 10 V/M ,

Modulation : AM 80 % , 1KHz . ON (YES) . OFF (___)

Start : 80 MHz , Stop : 1000 MHz . DC Power : 12 Vdc

Pulse modulation: 1 Hz ON (YES) . OFF (___)

Start : 80 MHz , Stop : 1000 MHz . DC Power : 12 Vdc

Criteria for Compliance:

There shall be no damage, malfunction or change of status due to the conditioning.

Flickering of an indicator during the conditioning is permissible, providing that there is no residual change in the EUT or any change in outputs.

10.1 Radio-Frequency Electromagnetic Field Test Description

Most electronic equipment is, in some manner, affected by electromagnetic radiation.

This radiation is frequently generated by such sources as the small hand-held radio transceivers that are used by operating, maintenance and security personnel, fixed-station radio and television transmitters, vehicle radio transmitters, and various industrial electromagnetic sources.

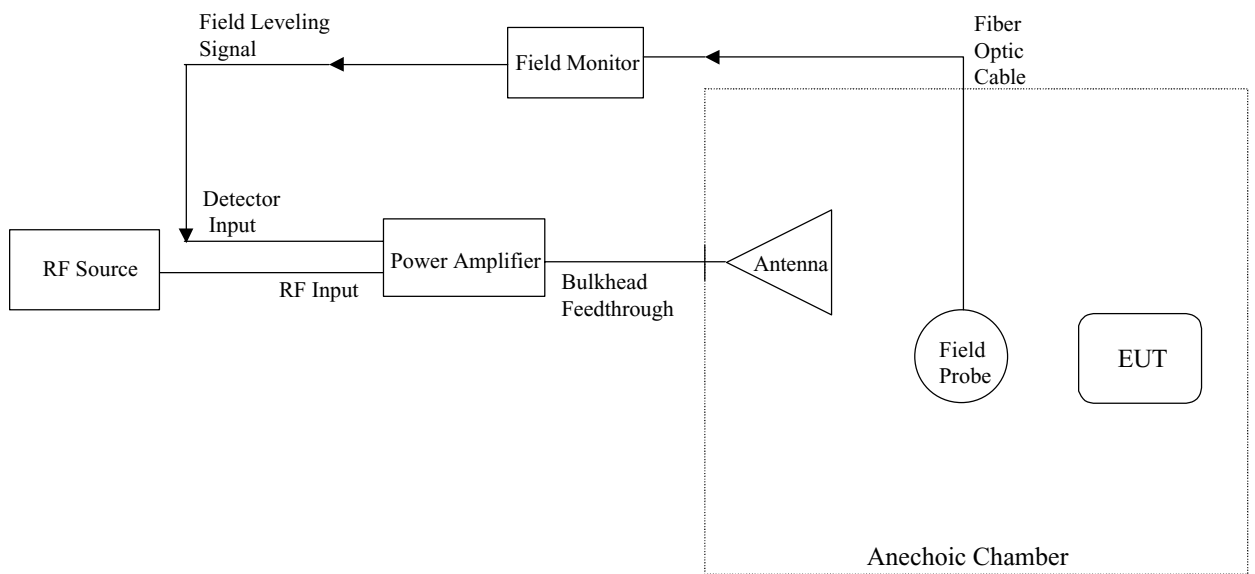

In addition to electromagnetic energy deliberately generated, there is also spurious radiation caused by devices such as welders, thyristors, fluorescent lights, switches operating inductive loads, etc. For the most part, this interference manifests itself as conducted electrical interference and, as such, is dealt with in other parts of this standard. Methods employed to prevent effects from electromagnetic fields will normally also reduce the effects from these sources.

The electromagnetic environment is determined by the strength of the electromagnetic field (field strength in volts per metre). The field strength is not easily measured without sophisticated instrumentation nor is it easily calculated by classical equations and formulae because of the effect of surrounding structures or the proximity of other equipment that will distort and/or reflect the electromagnetic waves.

All testing of equipment shall be performed in a configuration as close as possible to the installed case. Wiring shall be consistent with the manufacturer's recommended procedures, and the equipment shall be in its housing with all covers and access panels in place, unless otherwise stated.

If the equipment is designed to be mounted in a panel, rack or cabinet, it shall be tested in this configuration.

10.2 Radio-Frequency Electromagnetic Field Test Block Diagram

10.3 Radio-Frequency Electromagnetic Field Test Limits

Frequency range	(MHz)	80 to 1000
Field strength ¹⁾	(V/m)	10
Modulation:		
Amplitude modulation		80%, 1 kHz, sinusoidal
Pulse modulation		1 Hz (0.5 s ON: 0.5 s OFF)
¹⁾ The field strength quoted is the RMS value for the continuous wave, before modulation.

11. EN 61000-4-4 Fast Transient Burst Test

Test standard	Model No.	Result
EN 61000-4-4	BS-800	Passed

Criteria for Compliance:

There shall be no damage, malfunction or change of status due to the conditioning.

Flickering of an indicator during the application of the bursts is permissible, providing that there is no residual change in the EUT or any change in outputs.

11.1 Fast Transient Bursts Test Description

The repetitive fast transient test is a test with bursts consisting of a number of fast transients, coupled into power supply, control and signal ports of electrical and electronic equipment. Significant for the test are the short rise time, the repetition rate and the low energy of the transients.

The test shall be carried out on the basis of a test plan including verification of the performances of the EUT as defined in the technical specification.

Climatic conditions

The tests shall be carried out in standard climatic conditions in accordance with IEC 68-1:

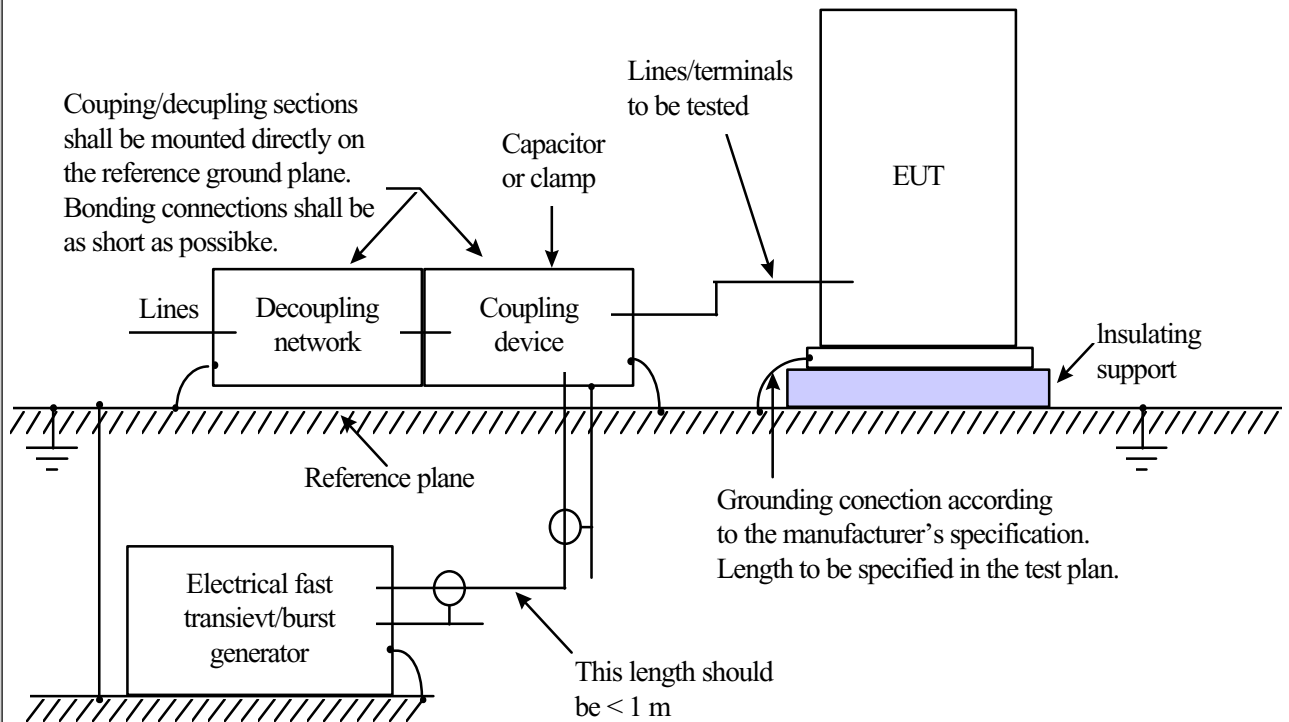

- ambient temperature: 15°C to 35°C
- relative humidity: 25% to 75%
- atmospheric pressure: 86kPa (860 mbar) to 106Kpa (1 060 mbar)

NOTE – Any other values are specified in the product specification.

Electromagnetic conditions

The electromagnetic conditions of the laboratory shall be such to guarantee the correct operation of the EUT in order not to influence the test results.

- Note :
1. "P" mean the EUT function is correct during the test .
 2. "F" ----- Fail
 3. "/" ----- no test
 4. Applicable only to cables which according to the manufacturer's specification supports communication on cable lengths greater than 3m.

12. EN 61000-4-5 Surge Immunity Test

Test standard	Model No.	Result
EN 61000-4-5	BS-800	Passed

Criteria for Compliance:

There shall be no damage, malfunction or change of status due to the conditioning.

Flickering of an indicator during the application of the surge is permissible, providing that there is no residual change in the EUT or any change in outputs.

12.1 Surge Immunity Test Description

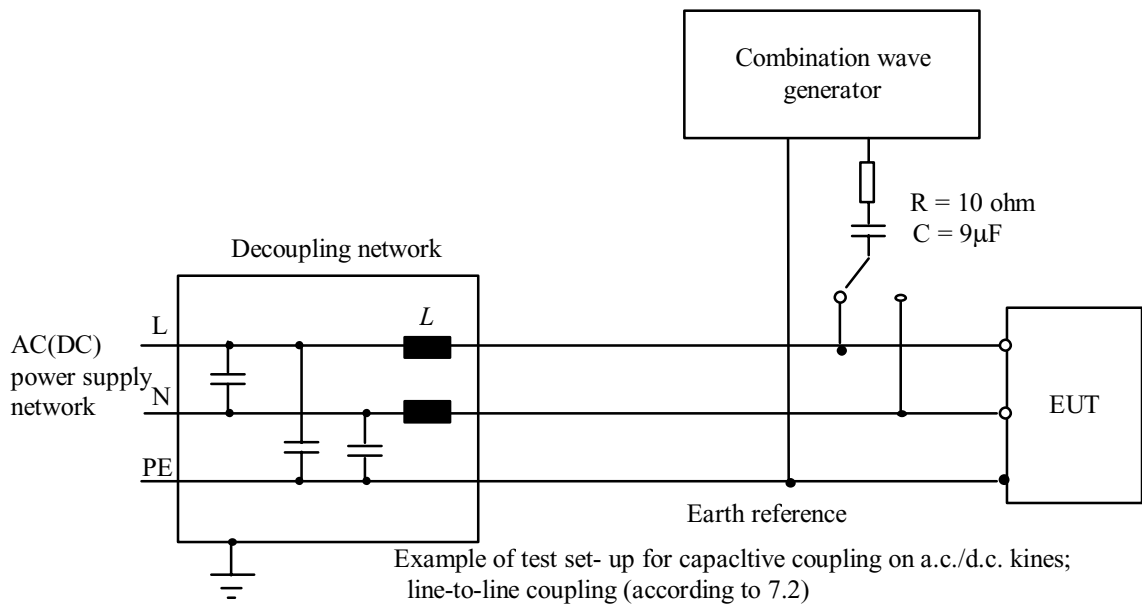

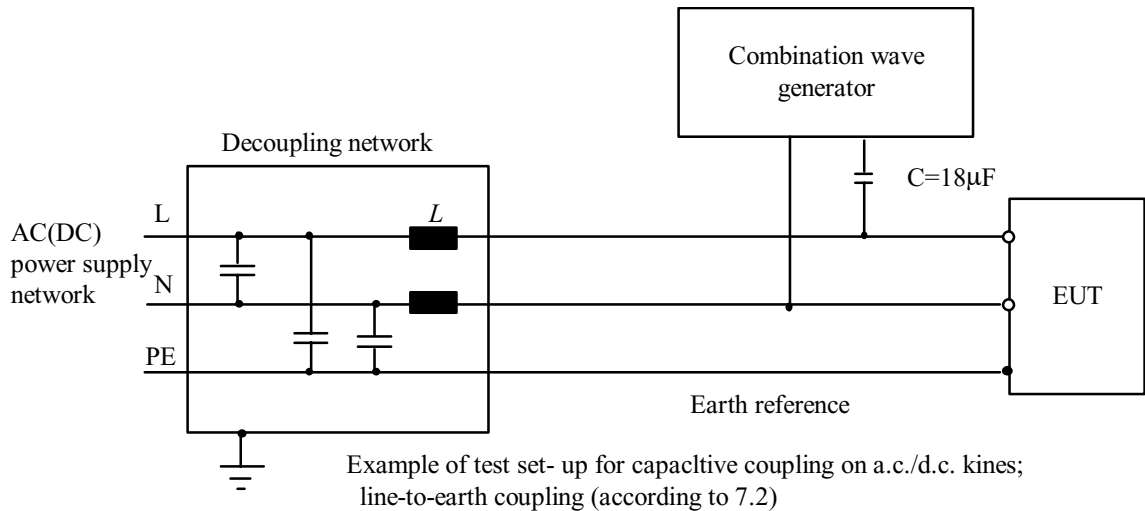

The task of the described laboratory test is to find the reaction of the EUT under specified operational conditions caused by surge voltages from switching and lightning effects at certain threat levels.

The following equipment is part of the test set-up :

- equipment under test (EUT);
- auxiliary equipment (AE);
- cables (of specified type and length);
- coupling device (capacitive or arrestors);
- test generator (combination wave generator, 1.2/50 μ s generator);
- decoupling network/protection devices;
- additional resistors, 10 ohm and 40 ohm

The surge is to be applied to the EUT power supply terminals via the capacitive coupling network. Decoupling networks are required in order to avoid possible adverse effects on equipment not under test that may be powered by the same lines and to provide sufficient decoupling impedance to the surge wave so that the specified wave may be developed on the lines under test .

12.2 Surge Immunity Test Setup

12.3 Surge Immunity Test Limits

Test voltages ¹⁾ :	
a. c. mains supply lines:	
- line-to-line (kV)	0.5 & 1
- line-to-ground ²⁾ (kV)	0.5; 1 & 2
other supply/signal lines:	
- line-to-ground ³⁾ (kV)	0.5 & 1
Polarity	+ & -
Minimum number of surges at each polarity, voltage, coupling mode and line:	
- a. c. mains supply lines	20 ⁴⁾
- other supply/signal lines	5
<p>¹⁾ The test voltages specified are the open-circuit voltages. The test voltages for the lower severity levels are included, because all the lower severity levels must also be satisfied.</p> <p>²⁾ via a 10 Ω series resistor.</p> <p>³⁾ via a 10 Ω series resistor.</p> <p>⁴⁾ 5 at each zero-crossing point and at the maximum and minimum points on the mains voltage wave.</p>

 2. " / " no test

13. EN 50130-4 Clause 7 Mains Supply Voltage Variations Test

Test standard	Model No.	Result
EN 50130-4 Clause 7	BS-800	Passed

Criteria for Compliance:

There shall be no damage, malfunction or change of status due to the different supply voltage conditions. The EUT shall meet the acceptance criteria for the functional test, during the conditioning.

13.1 EN 50130-4 Clause 7 Mains Supply Voltage Variations Tests Description

To demonstrate the ability of the equipment to function correctly over the anticipated range of mains supply voltage conditions.

Subject the specimen to each of the power supply conditions, indicated in table 1, until temperature stability is reached:

Table 1		
Supply voltage max	(Umax)	Unom + 10%
Supply voltage min	(Umin)	Unom – 15%
<p>Unom = Nominal mains voltage. Where provision is made to Adapt the equipment to suit a number of nominal supply voltages (e.g. by transformer tap changing), the above conditioning severity shall be applied for each nominal voltage, with the equipment suitably adapted. For equipment which is claimed to be suitable for a range of nominal mains voltages(e.g.220/240 V) without adaptation, Umax = (Maximum Unom) + 10%,and Umin = (Minimum Unom) – 15%. In any case the range of Unom must include the European nominal mains voltage of 230 V.</p>

15. EUT Photographs

MODEL NO. : BS-800

VERIFICATION

of conformity with European EMC Directive

No. E920735

Document holder: YUAN HSUN ELECTRIC CO., LTD.

Type of equipment: Barrier (Curtain) Sensor

Type designation: BS-200, BS-400, BS-600, BS-800

A sample of the equipment has been tested for CE-marking according to the EMC Directive, 89/336/EEC. & 92/31/EEC & 93/68/EEC *Standard(s) used for showing compliance with the essential requirements of the directive:*

Standard(s):

EN 55022 : 1998 + A1: 2000
EN 61000-3-2:2000
EN 61000-3-3:1995 + A1: 2001

Class B

EN 50130-4 :1995 + A1:1998 EN 61000-4-2: 1995 + A2: 2001
EN 61000-4-3: 1996 + A2: 2001
EN 61000-4-4: 1995 + A2: 2001
EN 61000-4-5: 1995 + A1: 2001
EN 61000-4-6: 1996 + A1: 2001
EN 61000-4-11: 1994 + A1: 2001
Main Supply Voltage Variations

Performance Criterion

The referred test report(s) show that the product fulfills the requirements in the EMC Directive for CE marking. On this basis, together with the manufacturer's own documented production control, the manufacturer (or his European authorized representative) can in his EC Declaration of Conformity verify compliance with the EMC Directive.

Declaration of Conformity

The following

Applicant : **YUAN HSUN ELECTRIC CO., LTD.**

Equipment : **Barrier (Curtain) Sensor**

Model No. : **BS-200, BS-400, BS-600, BS-800**

Report No. : **E920735**

is herewith confirmed to comply with the requirements set out in the Council Directive on the Approximation of the Laws of the Member States relating to Electromagnetic Compatibility(89/336/EEC) and the amendments in the Council Directive 92/31/EEC, 93/68/EEC.

For the evaluation of above mentioned Directives, the following standards were applied:

- 1) EN 55022: 1998+A1 : 2000 Class B
- 2) EN 61000-3-2 : 2000
- 3) EN 61000-3-3 : 1995+A1: 2001
- 4) EN 50130-4:1995 +A1:1998 EN 61000-4-2 : 1995+A2: 2001
- EN 61000-4-3 : 1996+A2: 2001
- EN 61000-4-4 : 1995+A2: 2001
- EN 61000-4-5 : 1995+A1: 2001
- EN 61000-4-6 : 1996+A1: 2001
- EN 61000-4-11 : 1994+A1: 2001
- Main Supply Voltage Variations
